1. RECAP Q3 / Q4 2025

1.1. RECAP Q3 / Q4 2025: JOIN (DECOS CLOUD PLATFORM)

After more than 5 years of intensive internal development on our new cloud platform, we are reaching an important milestone this year: we are entering the market with a renewed, modern, and future-proof platform. In the coming months, we will participate in tenders and begin the phased migration of existing customers from current solutions to the new products within our Decos cloud platform.

The new platform serves as the central foundation where all our products come together. Decos Cloud is a powerful and functional rich platform that interacts with users with a simple and modern app-like experience, enabling organizations to manage information internally and externally with ease without compromising on functionality.

For the past five years, we used the working name DCP internally. But now it is time for a full-fledged, recognizable, and powerful platform brand: **JOIN**

During the last year, JOIN has reinvented itself, built on the latest technologies, designed with usability at its core, and engineered for scalability. We remain the trusted JOIN provider our customers know, but now with a completely refreshed experience and significantly expanded capabilities.

In the years ahead, every existing product within the Decos Technology Group will be given a defined place within the JOIN Platform. This means we will evolve into a cohesive suite of integrated software products, including:

- JOIN Case & Document
- JOIN Customer Contact
- JOIN Integration
- JOIN Form
- JOIN DMS
- JOIN Portal
- ...and more, all unified within a single platform.

From this point forward, we will no longer use the name DCP, JOIN is the platform on which we will build, innovate, and collaborate with our customers

In the second half of 2025 the focus remained on preparing JOIN (DCP) for first municipal tender (case system) and onboarding the first customer. Many new features have been added to the solution stack: Below is an overview of what we have developed.

1.1.1. JOIN (Decos Cloud platform)

1. Document creation (templates) – version 1.0 will be completed in first half of 2026

We have introduced native templates including builder (fields, blocks and themes) and merging to actual files. In first version we have focused on word-templates.

2. Many features related to Record Management (to meet compliancy for NEN-ISO 16175)

To get the certificate for 16175 ISO compliancy we have introduced many new capabilities, such as:

- Disposal and export of records
- Audit on admin changes
- Calculating hashes on files and file modifications

3. Workflow (designer and task center) – version 1.0 will be completed in Q1 2026

Workflow is a massive project containing both builder (an advanced grid to design workflows) and front end, to allow end users to handle tasks, process checklists and take decisions. In the first version we have focused on workflow for processes. In 2026 we will expand to other objects such as documents, custom objects, dossiers and document types. Decision making will also require expansion of workflow capabilities such as approval routes for proposals.

4. External Data Integration

With External Data Integration it is possible to fetch data from an external source and store it in a collection in JOIN.

5. Event subscriptions

With events we have introduced an advanced trigger system that allows us to automate the sending of changes from JOIN to other vendors (through JOIN integration)

6. Forms and formbuilder - version 1.0 will be completed in first half of 2026

With the introduction of native forms in JOIN we have set a massive step towards replacing Seneca Forms Server with JOIN Form. The first version (to be finalized in the first months of 2026) contains an advanced form builder, the execution of forms (run forms) and first integrations, such as integration with our process system, DigiD and online payment.

7. Disposal list and export

Disposal lists are used to officially (and according archiving law regulations) destroy records from the system. Within this flow records can be transferred to an external system (e-Depot). This project will be completed at the end of January/beginning of February.

8. Process to Process relations

With this we have introduced the capabilities for:

- Subcases
- Follow up cases
- Related cases

These features are part of the process management system.

9. Macros and advanced field calculations

With Macro complex calculations and lookups can be made within the collection forms of JOIN. With macro's we introduce an advanced editor and API that helps in automating and improving quality of record creation flows.

10. Audit on admin

One of the important features to become 16175 compliant is the audit on admin changes. Not all audit actions have been implemented; next phase will be picked up in 2026.

11. Anonymization (calling external supplier)

With this feature it is possible to send a document from JOIN UI to one of the connected anonymizing vendors, such as XXLINC and E-data. The feature involves both the UI from any collection and the integration to call 3rd party solutions. Carp-e integration will be added.

12. Custom item types

The power of current JOIN is its flexibility to serve all types of markets and not only the governmental market for case systems. Custom item types are a powerful solution, but with their limitations. In JOIN we have redeveloped this feature and learned from these limitations. Custom item types can be configured in admin (zero coding) and allow our customers to combine with all existing features in JOIN.

13. OCR (automatic text recognition on scans and files)

With OCR we automatically extract text from scan images. These texts can be saved to our search engine or can be consumed by any AI service.

14. Cockpit 1.0

The cockpit in JOIN enables our consultant to set up, deploy and manage a tenant. The cockpit is part of JOIN and can be used by our Decos colleagues and partners.

15. Postpone, reject and extend (case handling)

These features are developed within the Process system (case management) and are important to meet our tender requirements. All these features are part of the case handling and monitoring service terms.

16. E mail viewer

We are introducing native viewers for various filetypes. Besides office- and PDF viewer we now support a native email viewer. It will help reducing the number of times a user of JOIN has to leave our application. This will improve the usability of our solution.

17. Saving mail to item

From 16175 ISO standard there are additional requirements for saving mail to the solution. With this solution it is not only possible to drag and drop mail from outlook to JOIN, but also separate the attachments from the mail and save them in a proper way.

18. Advanced Drag & Drop

Drag & Drop has become one of our most advanced features within JOIN. You can drop any (or multiple files into JOIN (full frame will become the dropzone)) and we automatically jump to the right context (like when you are in a folder we automatically open the document panel or create a document runtime).

With these achievements we were able to submit to the first municipal tender end of 2025 (Leusden / KB&P) and we convinced customer Hecht to join our platform.

1.1.2. JOIN Integration (JIP)

In the second half of 2025, JOIN Integration became a part of JOIN (DCP). For this, we migrated all integrations to the new JOIN Integration platform. Further, the focus was on delivering more integrations that were needed for the KB&P tenders and the POC at Amsterdam for HaalCentraal. In that light, the following integrations have been delivered.

- KVK – JOIN (DCP)
- BAG – JOIN (DCP)
- Anonymization – JOIN (DCP)
- Custom integrations – JOIN (DCP)
- Sharepoint – JOIN (DCP) (POC)
- HaalCentraal BRP bevragen – JOIN Original

1.2. RECAP Q3 / Q4 EXISTING PRODUCTS

1.2.1. Decos

JOIN Case and Document Original

For JZD Original and its related solutions we have worked on the following areas:

- Postex integration for JZD Original
- major Angular upgrade (Burgerberichten, agenderen, Elastic)
- Improvement of WOO Portaal
 - o WCAG compliancy for the WOO Portal
 - o WOO improvements (optimizing WOO Process in JZD Original)

Integrations

For current integrations within JZD Original we have updated all our ZGW API's to the latest version (mostly version 1.5) and we have worked on the introduction of the ZGW Transaction Messenger (part of JIA). This has not yet been completed and will be finalized in Q1 2026.

JOIN Klantcontact

- We have introduced a new feature: Report API
- AI Summarizing products and theme pages

Fixi

We have made several improvements with Fixi in the second half year of 2025:

- Update issues in bulk
- Dashboard improvements (performance and UI changes)
- Enhancements to text editors ((default) responses, categories) and management of standard responses
- Create and save filters (personal and group)
- Host Fixi under the organization's web domain
- Send emails using the organization's email domain
- Follow issues and receive updates
- Drag and drop files in Fixi
- Improvements to in-app notifications
- Integration with Moon shows live status of malfunction
- Integration with AD – synchronize users
- Improvements in digital accessibility
- Enhancements to forwarding issues

Furthermore with the addition of GeoJunxion to the Decos Technology Group we are able to deliver customized maps within Fixi with the help of the services of GeoJunxion. With this addition Fixi is able to operate in new markets: Facility and hospitality

WePlog

The second half year focused on the migration of Weplog from the formal external party to Decos.

Futhermore we have made some improvements:

- Improvements in location determination
- Multiple UI enhancements to improve user experience
- Improvements in push notifications
- New terms of use

1.2.2. CenterOne

ProcessPro

In the second half of 2025, we made numerous improvements to the Permits (Vergunningen), Supervision & Enforcement (Toezicht & Handhaving), and Incident Reporting (Incidentmeldingen) modules.

- The integration with the DSO now supports STAM 6.
- For the Groundwater Extraction (Grondwateronttrekking) module, export to LGR has been completed.
- The Water Assessment (Watertoets) module has been made available in Blazor.
- Work has begun on adapting the Survey (Schouw) module for Deep Survey (Diepteschouw)/Dredge Survey (Baggerschouw).
- All known technical debt in Blazor and API has been eliminated.

ConnectOne

In the second half of 2025, we made numerous improvements in the core of ConnectOne.

- The integration with the DSO now supports STAM 6.
- Upgraded Angular to version 20.3.
- All known technical debt in ConnectOne and API has been eliminated.
- Preview functionality for documents
- Appsetting to disable Requests (Verzoeken) for customers who only use collaborations (Samenwerkingen).

1.2.3. Ziuz Forensics and Digital Investigation

Fenoz

Fenoz is advancing at a great rythm. Out of the 5 modules that need to be completed for Fenoz to be released, we have completed 4 in Q3 and Q4. The UI for Fenoz has started and is still in progress to be completed fully. Half of the Designs have been developed.

VizX

We Keep improving also our application VizX2

- We implemented a Licensing tool for VizX2, which was previously nonexistent.
- Technical debt that has been resolved:

- Change Fenoz Demo VM password
- Change password for all demo accounts for VizX2
- Change azure Devops CI/CD pipeline PAT
- Change password for Azure container registry
- Change password for build server storage account
- Change password for PEM files
- Change database credential for VizX2

1.2.4. Seneca

Formulierenserver

For Formserver we have done two release in second halfyear of 2025:

- Major release (august)
 - o Multilingual
 - o WGAC Compliancy
 - o New payment provider
- Minor Release (December)
 - o Focusing on security and stability

SmartSite

In 2025 we made many changes in the front end of the Smartsite manager (UI was very outdated). Besides this, we have introduced new features in our enterprise search engine (the engine that runs behind our websites), such as fuzzy search and suggestions. Release was originally planned for December but needed to be postponed because of security (penetration test) findings. Smartsite 8.2 will be released in Q1.

1.3. RECAP Q3 / Q4 AI

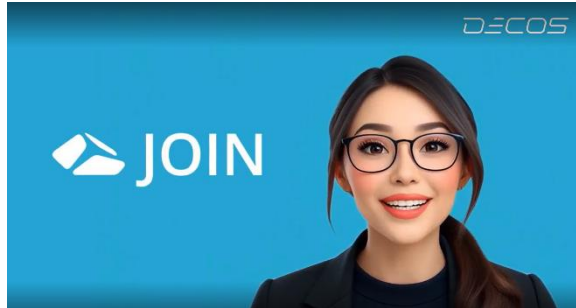

An important milestone in our plans over the past 6 months and the period coming is to gain speed with development of AI capabilities throughout the majority of our solutions. We already have made significant contribution to AI in many of our solutions. This means that we are not only focused on new development, such as JOIN (DCP). Instead, we have and will invest significantly in our existing solutions (such as JOIN Case and Document Original and Fixi) that will help us in our transition towards JOIN (DCP) and reduce attrition of our current customer base. When successful we might also be able to get new customers on our existing solutions.

Further Details of our AI plan can be found in this document: [AI Approach.docx](#)

In the past half year, we have achieved the following milestones in our AI efforts

JONI – Multilingual AI Assistant for Basic Customer Queries

- Delivered first working version of JONI, capable of answering case-type queries such as *“How do I register in JOIN Original?”*
- Added multilingual support: Dutch, German, English, French, Spanish, and Hindi.
- Although not yet multi-tenant, the MVP successfully generated customer excitement and validated its usefulness. Refer below [section here](#) for details

DocuParse – AI Summarization & Auto-Categorization API

- Developed and integrated DocuParse API into JKC and Fixi (implementation ongoing in Fixi).
- Generates concise, high-quality summaries of long documents.
- Automatically categorizes documents (e.g., permits, contracts, reports, emails).
- Supports Text and also multiple file types: PDF, DOCX, TXT, MSG, EML.
- Provides reusable intelligence that can be plugged into multiple Decos solutions

Leerlingenvervoer (Student Transport) – AI-Driven Eligibility Assessment

- Introduced a modern conversational interface, transforming static forms into interactive, user-friendly workflows.
- Embedded "human-in-the-loop" design: AI suggestions combined with interactive button-based decisions.
- **AI-Driven Bylaw Processing**
 - System automatically reads and processes municipal bylaws from websites
 - Generates structured rule templates without coding.
 - Enables:
 - Zero-code onboarding for new municipalities.
 - Automatic rule extraction and validation logic generation.
 - High scalability: works for any municipality, even non-Decos customers.
 - Simple maintainability: updating bylaws
- **Real-Time API Integrations - Integrated four Dutch public-service APIs:**
 - 10,000+ pre-geocoded schools → instant location-based school suggestions
 - NS 9292 → live public transport cost calculation.

- OpenStreetMap routing → accurate cycling distance and route planning.
- Rijksoverheid holidays → correct working-day calculations excluding school holidays.
- **Leerlingenvervoer ↔ JZD Original integration [In-Progress Items (2025 → 2026)]**
Automating creation of case along files in the case management system

On-Prem LLM Setup in Noordwijk Office

- Successfully configured a locally hosted, safeguarded LLM environment.
- Designed to serve multiple Decos products
- Completed a PoC connecting this local model with Leerlingenvervoer, validating internal AI capability.

2. ROADMAP ITEMS Q1 / Q2 2026

2.1. JOIN (DCP)

2.1.1. goals of JOIN for Q1/Q2 2026 (DCP)

We defined the following goals with JOIN (DCP) in the first half year of 2026:

1. First small customer onboarded to JOIN Case and Document (within DCP)
2. POC OpenZaak with municipality Amsterdam
3. HaalCentraal integration live with customer Amsterdam and NRGD
4. Participate and win KB&P municipal tender
5. Move away from MENUET LV.NU and bring Student Transport to JOIN Leerlingenvervoer
6. Do our first tender with JOIN Form

To achieve these goals we will have several actions on our roadmap that is divided over the 4 product owners and their respective development teams:

- David (DCP Team 1)
- Dharmesh (DCP Team 2)
- Sander (DCP Team 3)
- Jorrit (DCP Team JIP)

2.1.2. Roadmap items JOIN (DCP)

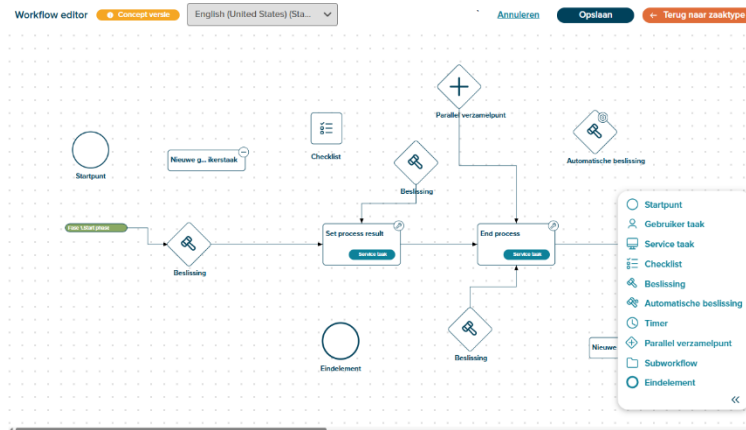

Team 1 Productowner: David

Workflow

One of the bigger epics in JOIN is the development of workflow capabilities that can be used within the full scope of the system. Workflow is not coupled with the process system, but can be used with any objects that has a need of process and process automation.

In 2025 first capabilities for workflow have been released:

- Introduction of Flowable as BPMN service that allows us to create and consume workflows in JOIN.
- Introduction of tasks
- Introduction of task center where users can manage their pending actions
- Introduction of workflow designer to create (advanced) workflows
- Introduction of front end for workflow, such as checklist handling

In first half of 2026 we will further expand the capabilities of workflow:

- Creation of workflow on document types
- Creation of workflow on all other objects, such as dossiers, regular document, custom objects.
- Introduction of process automation controls ("computeractions"), for example to create items and merge templates or to send notifications from workflow execution
- Decision making capabilities, such as approval routes on proposals

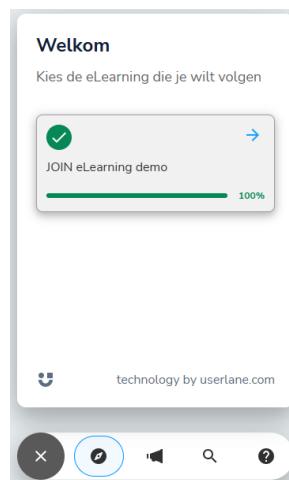

Workflow capabilities are required to achieve the 5 goals mentioned in the chapter "Goals of JOIN" except the HaalCentraal Goal.

Workflow capabilities will be implemented in both Q1 and Q2 of 2026.

E-Learning

For the KB&P tender supporting native E-Learning solution is a requirement. For this reason we will implement first capability with the Userlane solution that can be fully embedded in the front end application. Userlane is also used within JOIN Case & Document original.

We aim to implement this feature in Q1 of 2026.

In future we expect that e-Learning can be developed native within our solutions. Our expectation that this can become one of the capabilities of our AI Agent "Joni".

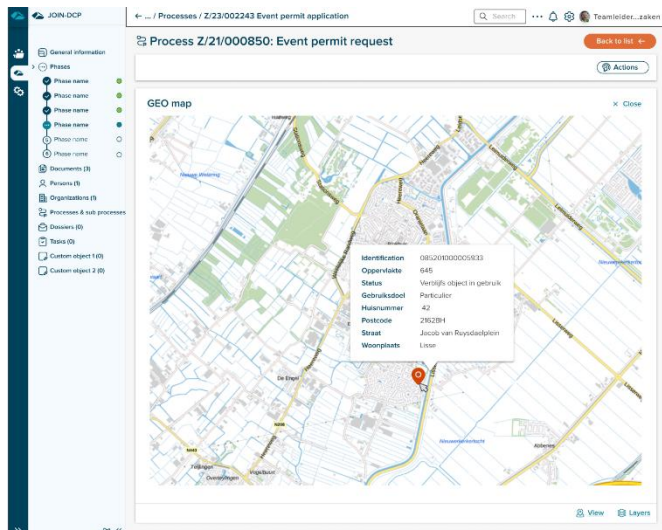

Only visible for

From tender it is demanded to make restrictions (confidentiality) on items that are more restrictive than the authorization that has been set on the item. This feature is also known as “only visible for”. We aim to start building this feature in Q1 and want to complete this feature in the same quarter.

GEO (Map)

In most of KB&P Tenders geo-based features are required to support in the (casesystem) solution. The following features are required:

- Showing geographical map with case item
- Select location and link with the case item
- Showing geographical map with the location object (for example BAG)
- Supporting WFS and WMS layers
- Expose cases through WFS and WMS (OGC API) layers

Example map visualization with a case in JOIN (DCP)

In first half of 2026 we will implement a map and mentioned features in JOIN. We will implement GEO in such a way that it will be possible to support the advanced GEO-capabilities of Fixi, ProcessPro and ConnectOne within JOIN. This will allow us in future to offer a mature VTH-system within the platform and move Fixi to the platform. Important architectural decisions have to be made on topics such as the storage of Geographical data, supporting advanced layers and tiles and supporting to draw and show geospatial objects.

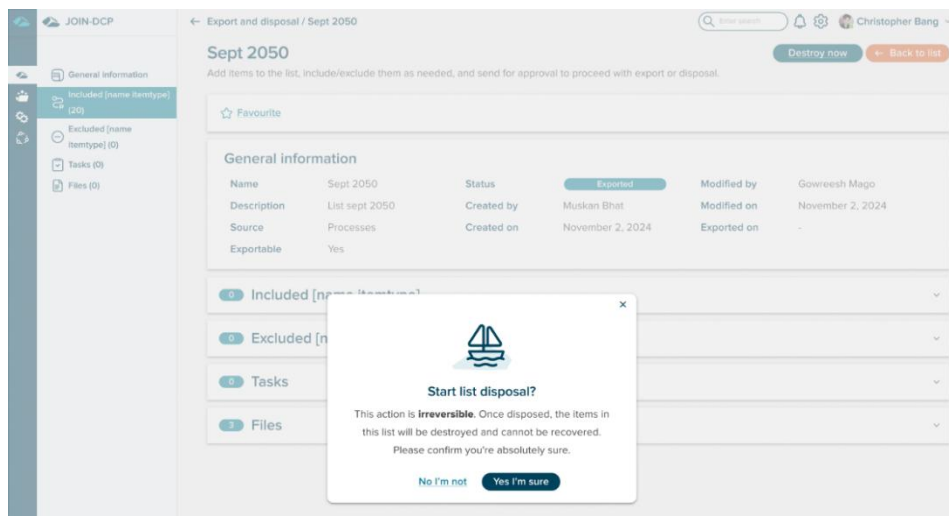

High end map capability in ProcessPro

Disposal lists

In Q4 of 2025 we have worked on the first version of disposal lists within JOIN. Disposal capabilities is one of the most important requirements in both KB&P tenders as well as the 16175 ISO compliancy.

Disposal list capabilities, such as creating a list on any object, include/exclude items and review and approval flows will be delivered in February. This means that the project that has been started in 2025 will be finalized in the first quarter of 2026. The feature will be available across the different solutions that run on the platform.

Decision making process

Again, one of the required features for the KB&P tender is the support of decision making process. First goal is to support the creation of a proposal document, link important attachments and handle the stages of decision making (review, approval, meet and decision taking). We will keep in mind that decision making module will be offered as a standalone solution in JOIN and that decision making flows are not exclusive to the case management system (but can be used within the DMS as well).

To have full support we will expand the capabilities in the following areas:

- New capabilities in workflow for approval routes and board approval
- Allow to link document types with meeting objects
- Allow to start (decision making) workflow on documents and document types
- Linking (internal) attachments with a decision making document
- Locking files during approval and decision taking phase
- Support decision list creation (templates)
- Collaborate on decision making documents during the concept stage

In current project creating meetings and setting up agenda structure (with topics, subtopics) will most likely be out of scope.

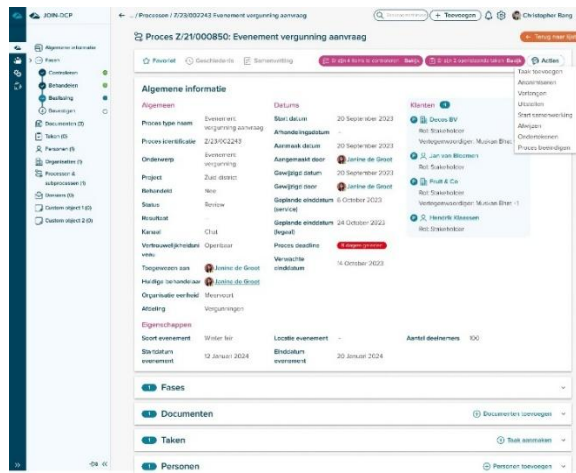

We expect to start this project in Q2 of 2026.

Integration JOIN Collaboration

One more Tender Requirement: support the collaboration on files within the solution (next to Teams, which will be taken care of by JOIN Integration team) with both internal and external stakeholders.

Our current solution JOIN Collaboration (that is already implemented on the Decos Cloud Platform) fits perfect with the Tender requirements. Unfortunately the solution is fully decoupled from the other capabilities in JOIN and its components are outdated (e.g. technical debt. This means that it is currently not possible to initiate a collaboration session from any object in JOIN, such as a document, a dossier or a process/case or process document.

With this project we will build the integration. First goal is to start collaboration session from a process and process document (as the tender requirement is related to the case system).

The flow should be circular. It should not only be possible to initiate collaboration session from an object in JOIN, it is also required to set state on the object (for example files should be locked during the collaboration session) and it is required to close a collaboration session and write back files and audit to the related object.

We expect to start this project in Q2. We might extend the scope of this project depending on an opportunity that we have with our customer RSJ. This should become more clear during the first quarter of 2026.

Other

Besides these bigger topics there will be more actions planned for the first half of 2026 that will benefit the goals we want to achieve with JOIN in 2026:

- Rework of UI Components to support above features (for example we need to rework document type in the process management system)
- Support linking process documents with other objects (for example to link a case document with meeting object).

Team 2 Productowner: Dharmesh

Reports:

Reporting is one of the most critical and complex components in our roadmap, with a significant impact on both customer experience and tender requirements. Our objective is to deliver a robust reporting solution that supports predefined reports initially and later expands to custom reporting capabilities. This will require integrating data from multiple databases across various microservices and presenting it in an intuitive, user-friendly interface through dashboards and a report builder.

The reporting solution will allow outputs in multiple formats such as lists, CSV, Excel, and will include options to share reports via email and schedule reports periodically for automation and convenience.

Phase 1 (Q1 2026): We will deliver Version 1 of predefined reports with basic filtering options. This milestone is crucial for strengthening our position in tender processes and providing immediate value to customers. Goal is to enable users to generate reports using natural language queries, reducing dependency on complex filters or manual field selection.

Next: Introduce a custom report builder to design complex overviews and visual dashboards. Provide integration options to expose data to other systems or Business Intelligence (BI) tools, ensuring flexibility and interoperability.

Check-In / Check-Out

This feature ensures controlled access to files and documents. Before working on a case or document, users may want to keep it private. By checking out an item, the user locks it, preventing others from viewing or modifying it until it is checked back in.

This functionality is not only a user convenience but also a requirement for **StUF** and **ZGW integrations**.

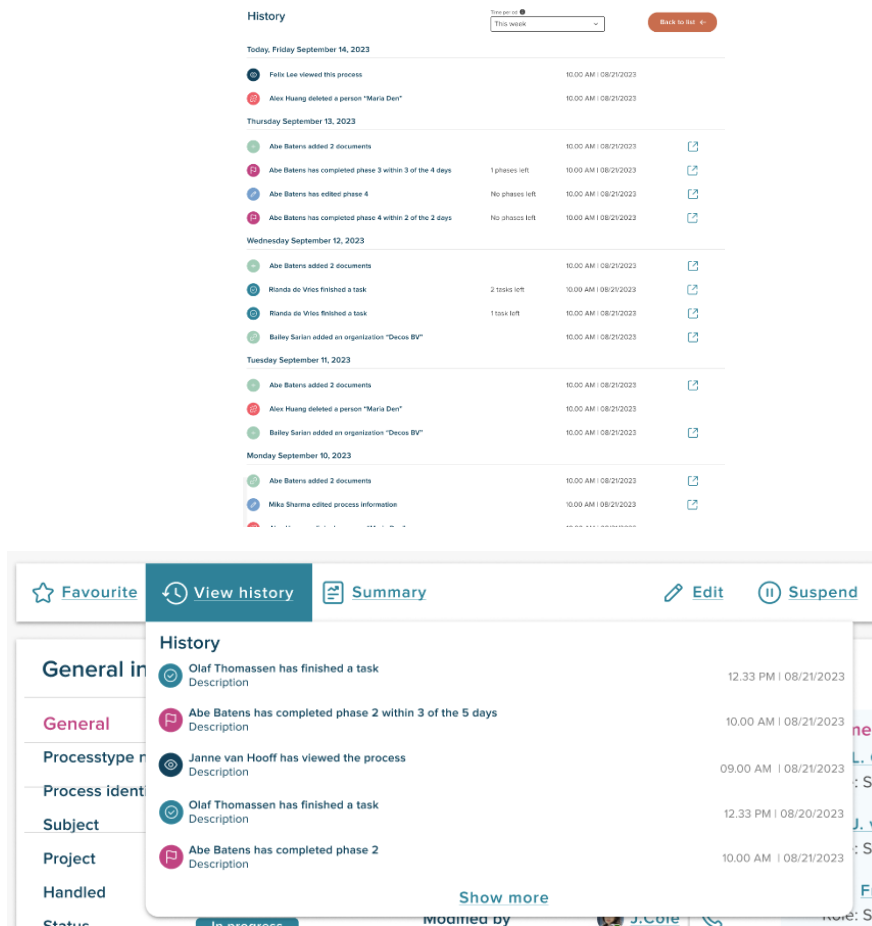

We aim to implement this feature in Q1 of 2026.

History (Audit Trail)

Transparency and traceability are crucial for **compliance and accountability**. The audit trail feature will log all activities on individual items and display them in a clear, chronological sequence.

A **"View History"** button on each item, showing all changes and events over time. This provides users with confidence and clarity on who did what and when.

Below designs are just for reference and not actual feature:

Delete Processes

Currently, processes and cases remain in the system indefinitely. This initiative introduces the ability to hard delete processes and cases when required. This is essential for implementing **disposal lists and archiving features**, ensuring data hygiene and compliance with retention policies.

We aim to implement this feature in Q1 of 2026, other item types will be done later.

Notes

Collaboration often requires context sharing. The Notes feature will allow multiple users to add comments or annotations on cases, documents, or other object types. Enhances teamwork and communication within the platform, reducing reliance on external tools for discussions.

We expect to implement this feature in Q2 of 2026.

Production Cluster Setup

To support scalability and reliability, we will set up a dedicated production cluster and make necessary adjustments in the cockpit for tenant management.

A robust infrastructure that ensures smooth operations for all tenants in a production environment.

Team 3: Productowner: Sander

Word templates

End of 2025 we started with creating Word templates. It is possible to create templates and use merge fields from document and case metadata. We will extend this with in Q1 with configuring AND using header & footer and logos in the template. End goal of this feature is to add a document to a case (or any other object) with a configured word template including the linked merge fields.

We aim to deliver this in Q1 2026

Email templates + Emailing in JOIN

This topic contains the following features:

- Configure email settings on tenant level

The screenshot shows the 'Settings' page in the JOIN DCP interface. The left sidebar contains navigation links: Admin, Dashboard, Organizational settings, User management, Users, Groups, Roles, Billing, Configuration, Settings (selected), Channels, Reports, Integrations management, Support, and Notifications. The main content area is titled 'Settings' and 'All settings'. It contains several sections: General, Anonymize, Archive, Authentication, Certificates, Document, Email, Form, and Navigation. The 'Email' section is expanded, showing 'Send emails' (DCP email server), 'Email domains' (example@email.nl, example@email.nl, example@email.nl), and a table for 'From address' with columns 'T1', 'Products', and 'Total: 3'. The table lists three email addresses and their corresponding products: 'Example@email.nl' for 'Eforms, DM license, PM license', 'Example@email.nl' for 'Eforms', and 'Example@email.nl' for 'Eforms, DM license, PM license, Collaboration'. There are 'Edit' and 'Add' buttons for each row.

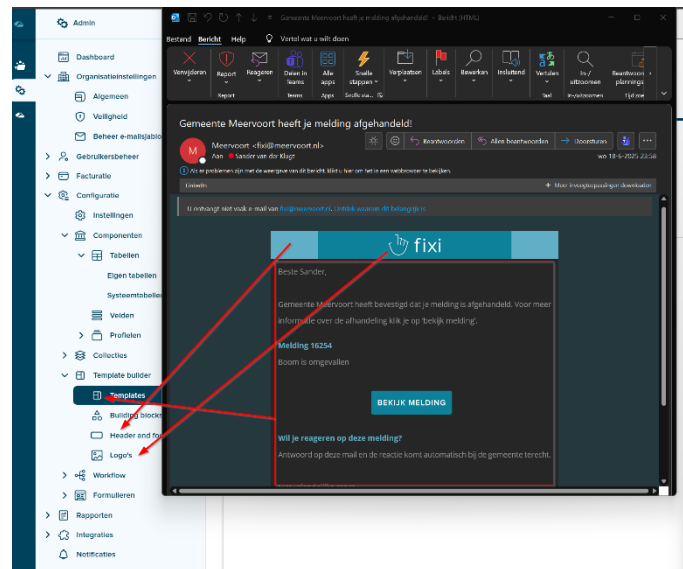

- Sending emails from item

It should be possible to send information of an object via email. Here you can find the design for a case:

The screenshot shows the 'Share via email' dialog in the JOIN DCP interface. The left sidebar contains navigation links: JOIN DCP, General information, Phases, Documents (2), Persons (4), Organizations (2), Processes & sub processes (2), Tasks (5), and Events (2). The main content area is titled 'Process Z/21/0008' and 'Share via email'. It contains a 'General Information' section with fields for 'Process type name', 'Process identifier', 'Subject', 'Project', 'Handled', 'Status', 'Result', 'Channel', 'Confidentiality level', 'Assigned to', 'Current handler', 'Organizational unit', and 'Department'. Below this is a 'Phases' section with a table of phases. The 'Documents' section is expanded, showing a table of documents. The 'Persons' section is expanded, showing a table of persons. The 'Organizations' section is expanded, showing a table of organizations. The 'Processes & sub processes' section is expanded, showing a table of processes. The 'Share via email' section contains fields for 'To', 'Reply To', 'Subject', 'Priority', and 'Message'. Below this is a section for 'Objects to share in the email' with checkboxes for 'Process (name) (metadata)' and 'Document files (none selected)'. There is an 'Expand all' button. At the bottom are 'Cancel' and 'Send' buttons.

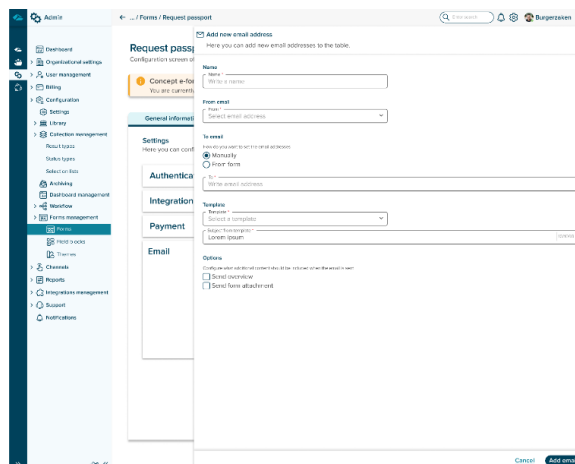

- Configure and use email templates

Currently there are some system email templates in JOIN available. We need to make some improvements to change those system email templates and create new ones including merge fields.

- Configure email setting on form level

As JOIN Form could be sold separately we need to have email settings on form level like from & to email address, email template and if we need to send the overview and uploaded attachments:

[JOIN Form] Login with DigiD, eHerkenning and eIDAS

In 2025 we already started configuring the authentication methods, but they're not active yet in the form. It should also be possible to configure multiple authentication methods on form level.

We aim to deliver this in Q1 2026

[JOIN Form] Prefilling details of persons and organizations

When user logs in (personal or organizational) we should show the data of the person/organization coming from the integration with BRP/KVK. Based on the authentication we get the BSN (Citizen Service number) or KVK number back and send that to the integration. The integration will forward the request to BRP/KVK and send back the details to the form.

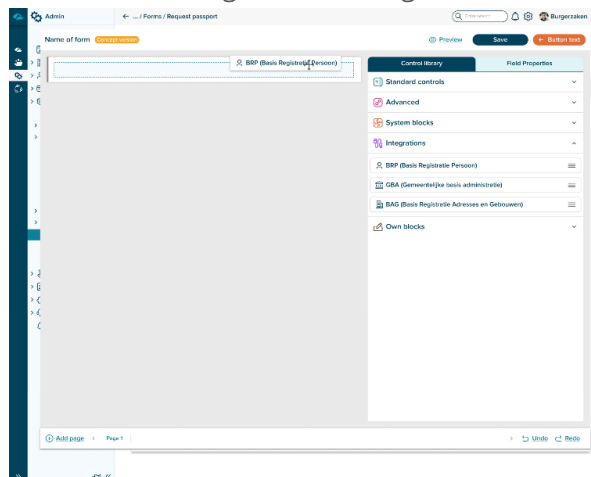

We aim to deliver this in Q1 2026

[JOIN Form] Configure integrations in the designer

Integrations are sometimes needed in between the question of the form, like:

- DUO (for getting data of schools)
- 9292ov (for student transport with public transport)
- BRP (f.e. when partner needs to login as well)

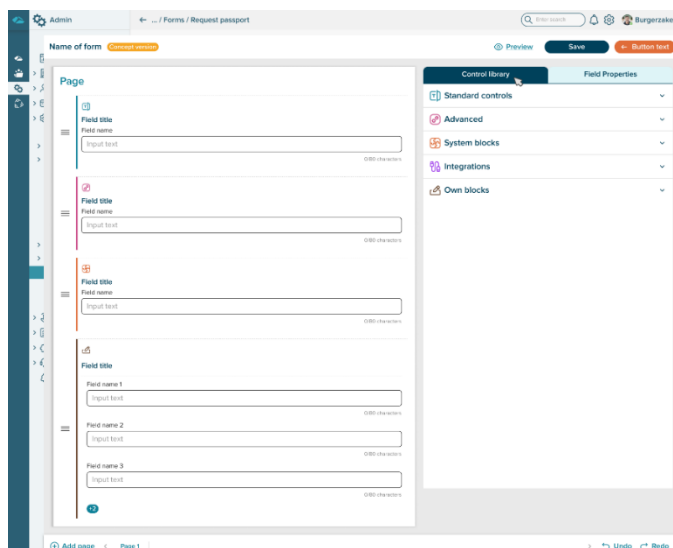

Here you can find the design how to Integrations will look in the library:

We aim to deliver this in Q1 2026

[JOIN Form] UI improvements in designer and improvements in multiple flows

As we wanted to deliver the existing JOIN Form functionalities fast, we spend less time in 'look & feel' and the 'not so happy flows'. In the designer we're going to make it more visible what kind of control is used in the form:

For the 'not so happy flows' you can think of the following:

- You should not be able to publish a form when a case type is linked, but the required fields are not mapped
- You should not be able to publish a form when a case type is linked, but there is no integration set on form level

We aim to deliver this in Q1 2026

[JOIN Form] Temporary saving and continue later

In almost every tender the feature 'Continue later' is asked. When user can't finish the form and wants to continue later, it should be possible via the Portal and form itself. For the form you can think of the following option:

Formulier is tussentijds opgeslagen
Om door te gaan waar u gebleven was kunt u deze link gebruiken.
Het tussentijds opgeslagen formulier blijft 105 dagen beschikbaar.

Tussentijds opslaan Volgende

Overzicht van de ingevulde gegevens

Zijn de ingevulde gegevens juist?

☐ Ja
☐ Nee

We aim to deliver this in Q1 2026

[JOIN Form] Repeat request

A repeat request is also a tender requirement. Any user needs to be able to do the same request easily without filling in all the details again after a year or so. Also, this functionality should be available via the Portal or via the form itself.

We aim to deliver this in Q2 2026

[JOIN Form] Audit all form actions and show them in history

Also for Forms there should be audit data available. We need to send it to the audit database, so user can query on audit for Forms. Next to that we would like to see the history of a form, form block and theme. There you want to see who did what and when.

We aim to deliver this in Q2 2026

[JOIN Form] Text pages

Text page like 'Form is successfully submitted' is something we are showing, but there will be customers who want to change the text or want to display information like 'Case ID' on the 'successfully submission text page'.

We aim to deliver this in Q2 2026

[JOIN Portal] Login, show details and add documents

There are big plans for the portal of JOIN, but we will start with the Tender requirements which are:

- Website with the theme of the organization
- Login with DigiD, eHerkenning, eIDAS
- Show personal details and open cases
- Possibility to add documents to cases

We aim to deliver this in Q2 2026

Bulk delete and handle

In all tender requirements there is a functionality asked where an user can do bulk actions like delete (case, document, person) or handle.

We aim to deliver this in Q2 2026

2.1.3. Roadmap items JOIN Integration

Productowner: Jorrit

JOIN Integration is a platform that can connect to various providers. The main provider we'll be focusing on is JOIN (DCP), but there are also some features related to JOIN Original provider. The provider will be specified with the integration to get a clear overall picture of what feature will be delivered.

As was the case for 2025 Q3/Q4 the main focus in 2026 Q1/Q2 will be on the KB&P tender requirements of the current tenders that we want to participate in. Besides that we start with the process to replace the Data Integrator with JOIN Integration and will participate in the openzaak POC with the municipality Amsterdam to show that JOIN can synchronize with openzaak and is following the common ground principles of the separation of the application layer and the data layer. Besides that we start with the process to replace the Data Integrator with JOIN Integration and will participate in the openzaak POC with the municipality Amsterdam to show that JOIN can synchronize with openzaak and is following the common ground principles of the separation of the application layer and the data layer.

Ongoing development

Below is an overview of the features on which work has already started. For most of them the expectation that they will be delivered end Q1, where this is not the case it will be specified.

Digital Signing – JOIN (DCP)

Digital Signing has been built natively in JOIN and is not running via JOIN Integration. With this integration, we can send signing requests to external signing applications. This application will handle the signing request. We'll add support for the following signing applications, ValidSign, Zynyo and ondertekenen.nl.

Internal API Gateway

The internal API Gateway is the gateway we standard use for all incoming traffic to our JOIN Integration platform. Here the public endpoints will be made available, so the gateway will become the only single controlled entry point for all integration. From there traffic is routed to the corresponding internal endpoints, following best practice. It protects internal infrastructure, decouples client from internal infrastructure

This is where we handle authentication, like basic, certificate, OAuth, IP whitelisting and rate limiting. This is done on an integration instance level within the JIP admin and not on a global customer level.

StUF-BG – JOIN (DCP)

StUF-BG integration enables standardized, reliable data exchange between municipal systems, ensuring access to basic information, from BGA (BRP), nHR and GBA-V.

StUF-ZKN – JOIN (DCP)

A StUF-ZKN integration enables systems to automatically create, update, retrieve, and synchronize case data, ensuring consistent and reliable information handling across case management systems, document systems, and back-office applications. Typical examples include exchanging data for permits, WMO processes, or other municipal case workflows. We offer support for ZSDMS 1.1 and 1.2 for the incoming messages. Main work needs to be done on processing notifications from JOIN to external application and checking in and out of documents from JOIN.

ZGW – JOIN (DCP)

The ZGW APIs (Zaakgericht Werken APIs) are a standardized set of REST APIs developed by VNG Realisatie to support case-oriented working within Dutch municipalities. They define how systems should create, read, update, and exchange case data, documents, case types, decisions, authorizations, and notifications in a consistent and interoperable way.

We'll support the Catalog, Zaken, Documenten, Besluiten, Autorisatie and Notificatie API's. Together, these APIs enable modern, modular, and Common Ground-aligned integration between municipal systems, replacing older StUF-based interfaces, and ensuring reliable, standardized data exchange.

We aim to deliver this feature beginning Q2.

BAG – JOIN Form

Allow JOIN Form to use the BAG Integration via JOIN Integration. Provider is JOIN Form

BAG

Hier vindt je alle details over de BAG integratie

Terug naar lijst

Algemene informatie

Instanties (3)

Instanties

DCP/Forms BAG do not change	EFORMBORM2SH	Geconfigureerd	15 sep 2025 - 19:36 uur	DCP eForm	

KVK – JOIN Form

Allow JOIN Form to use the KVK Integration via JOIN Integration. Provider is JOIN Form.

8. HaalCentraal BRP – JOIN (DCP)

Haal Centraal enables governments to fetch reliable, real-time base data directly from national registries through standardized APIs. These APIs provide safe, up-to-date access to key registries such as BAG, BRK, WOZ, and BRP, and are aligned with the Common Ground vision and the GEMMA data architecture. This feature focuses on the BRP.

9. HaalCentraal BRP Mutationsservice – JOIN Original

This is part 2 of the HaalCentraal integration with Join Original at Amsterdam. Part 1 covered querying the BRP via Amsterdam B&K. Part 2 is about the mutation service of HaalCentraal via Amsterdam B&K, which updates existing entries in the Join Original address book.

10. External API Gateway

We are now moving towards a new integration platform (JOIN Integration) that will decouple the integrations from our key systems and provide additional features such as API-gateway, message queuing, logging, routing and eventually transformations. With this shift we are also able to act as an independent Integration supplier: we can add new customers that don't use any of our feature applications but have an integration need. This External API Gateway is also one of the requirements for realizing the Digikoppeling (see next paragraph)

We aim to deliver this feature beginning of Q2.

11. Sharepoint – JOIN (DCP)

In Q4 a POC was conducted, where documents from Sharepoint were shared successfully with JOIN. This feature will further develop this sync between Sharepoint and JOIN. To synchronize data and storage structures between the two environments.

We aim to deliver this feature at the end of Q2.

Future integrations

Finally, I'll list the integrations on which work still needs to start. In general, the expectation is that these features will not be delivered earlier than the end of Q2 but they will start in Q1/Q2. Where this is not the case, it will be specified.

Openzaak sync – JOIN (DCP)

This is part of the POC at Amsterdam where we can show that JOIN is OpenZaak compliant and in this way following the Common Ground principles. Based on notifications that we receive from OpenZaak or JOIN this feature will translate that information into a proper ZGW call towards the otherside, also taking the documents in Alfresco into account. A small start has been made, but there is a dependency on the ZGW api (see previous paragraph). We're still awaiting official confirmation that this project will start. We expect to deliver this feature in Q2, but dependency on the above-mentioned points could influence this.

StUFDCR – JOIN (DCP)

StUFDCR standardizes how a Document Creation Requestor (DCV) and a Document Creation Application (DCA) exchange the data required to generate documents, ensuring one-to-one, error-free data transfer and efficient integration with case-oriented workflows. After creation, documents can automatically be stored in the corresponding case file. There is a dependency on JOIN from an events perspective, and in JOIN you should be able to select an external template.

Planning still needs to start, but it will include the three different processes and three vendors, Xential, Templafy, SmartDocuments.

MS Teams integration – JOIN (DCP)

This feature will cover the integration between MS Teams and JOIN. This integration is a returning tender requirement, but what the integration entails is usually not specified. At this moment it is not yet clear what features we will implement. This will be prepared in Q1 and will be implemented in Q2. Possible features:

- Link a case to a channel from JOIN
- Link a document to a channel from JOIN
- Link a case to a channel from MS Teams
- Link documents from a team to a case in MS Teams
- Show with each document in Teams how it is saved to the case (ID, link)
- Show the reference with MS Teams from JOIN Original

Postex – JOIN (DCP)

The feature allows a user within JOIN to select and send a document to Postex. Postex will take care of the delivery of the document to a citizen's preferred communication channel, such as mail or Berichtenbox.

Features such as Bulk sending of documents and Sending documents from workflow will be developed at a later stage.

Berichtenbox – JOIN (DCP)

The Berichtenbox is your personal digital mailbox within MijnOverheid, where you receive official messages from Dutch government organisations. These messages can include things like tax notifications, passport renewal reminders, benefit information, child benefit updates, or pension letters. It is mandatory to use DigiKoppeling for this connection. The DigiKoppeling is not part of this integration.

e-Depot – JOIN (DCP)

An MDTO export is the process of exporting digital records from a source system (such as a Document Management System) together with their metadata, formatted according to the MDTO standard (Metagegevens voor Duurzaam Toegankelijke Overheidsinformatie). This standard ensures that government information remains findable, readable, interpretable, and reliable over the long term.

The exported files and metadata are delivered to an e-Depot, which is a digital preservation environment for long-term storage of government archives.

Investigation will take place in Q1 and work to start in Q2.

7. DigiKoppeling

DigiKoppeling is a set of standards that defines how (semi-)government organizations in the Netherlands securely and reliably exchange electronic messages with each other.

It acts like a digital envelope: it does not define the content of the message, only how it is packaged, addressed, transported, and delivered.

The DigiKoppeling can be used to transfer data via the DigiNetwerk or via the public internet. To connect to the DigiNetwerk we have a dependency on an external party. In Q1 we will investigate the requirements for this connection to the DigiNetwerk

It consists of several interface standards, such as:

- WUS – for synchronous queries (direct responses),
- ebMS2 – for asynchronous messaging (notifications),
- GB – for exchanging large messages.

Our first focus will be on the ebMS2 standard.

8. LV Integrations

Transfer logic and routing from integrations with 9292.ov, DUO, Holidays per Region and OSM from eforms of Student Transport to JIP.

2.2. AI ROADMAP

Leerlingenvervoer – Scaling & Integrations

- JZD Original integration to automatically create cases and link AI based decision pre assessment.
- JOIN (DCP) integration for unified document handling and processing.
- Production grade scalability, enabling higher throughput using a local LLM for privacy safe, high volume processing.

Smartsite – AI Enhancements

AI Powered Content Writing

- AI improves article clarity, tone, and accessibility.
- Adjustable writing levels (A1, A2, B1) for inclusiveness.
- Semantic improvements to boost SEO ranking and content quality.

Predictive & Semantic Search

- Auto-complete, semantic, and vector-based search.
- Helps users find related content beyond exact keywords.
- Reduces time to locate information and improves search accuracy.

Fixi – AI for issue handling

Image Based Issue Categorization

- AI describes the issue from an image and selects the correct category automatically.
- Enables faster and more accurate ticket creation.

Auto Generated Handle Summaries

- AI drafts closing summaries for resolved tickets.
- Standardizes quality and reduces resolution time.

Internal processes – support automation

AI Support Assistant (Freshdesk + Knowledge Base)

- Generates first response messages for incoming support tickets.
- Answers questions about release notes, documentation, and FAQs.
- Reduces response time and improves customer satisfaction

JZD Original and JOIN (DCP) – Document Intelligence

Document Summarization

- Automatically summarizes emails, scanned files, and uploaded documents.
- Provides quick insights and helps caseworkers process information efficiently.

JONI – Next-level Capabilities

- Summarize uploaded files directly via JONI.
- Extract structured information from documents.
- Create new records through conversational AI.

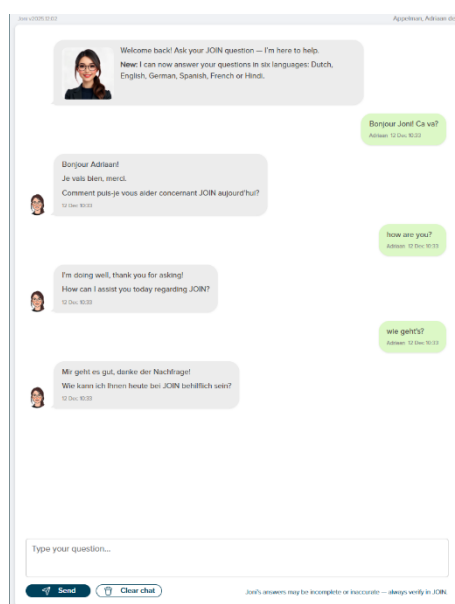

In JOIN Case & Document Original we have introduced our AI Agent Joni in the second half

of 2026. We will be extending her capabilities and will keep all AI capabilities for JOIN Case & Document Original centralized in this area.

In first half of 2026 we aim for the following features:

- Multilingual chat support
- Uploading files to Joni
- Summarizing files with Joni
- Extracting files with Joni
- Creating new records with Joni

This means that, when available in our solution, Joni will be able to help users with giving insights in document content and help with creating new items in JOIN, such as case or case document and adding metadata to the record.

JOIN (DCP) – Report Conversational Reporting

- Natural-language queries such as “*Show me cases closed last month*” generate instant charts and metrics.
- Reduces dependency on custom report development.

JOIN (DCP) and JZD Original (potential) – AI Powered Intake

- Automated processing of incoming emails and attachments.
 - Intelligent classification, case creation, and document storage.
 - Prioritization based on **sentiment** and **urgency**.
 - Substantially reduces manual workload and speeds up intake operations.
- We are first focusing on quick-wins, so this will be taken at last if time permits

2.3. EXISTING PRODUCTS

2.3.1. Decos

JOIN Case and Document Original

Productowner: David

For the JOIN original Solution stack we have many interesting projects coming up in first half of 2026. We want to emphasize the stability, security and reliability of the system and also improve and extend the capabilities of the features that have potential in the upcoming months, such as Postex, MS Teams and the WOO Portal.

Achieve the highest possible security level: support TLS 1.3

TLS stands for **Transport Layer Security**. It's a cryptographic protocol designed to provide secure communication over a computer network. TLS is widely used to secure connections between web browsers and servers (HTTPS), email, messaging, and other data transfers. Here are the key aspects of TLS:

- **Encryption:** It encrypts data so that third parties cannot read it during transmission.
- **Authentication:** It verifies the identity of the communicating parties, usually through digital certificates.
- **Integrity:** It ensures that data is not altered during transmission.

TLS is the successor to SSL (Secure Sockets Layer) and is considered more secure and efficient. The latest version is **TLS 1.3**, which offers improved performance and stronger security compared to previous versions.

TLS is a very important standard for all JOIN Original components because of the type of data that is transferred on high volume from and to JOIN Original.

In first half of 2026 we will enable support for TLS 1.3. However we will not disable TLS 1.2. This will cause problems in our integrations as we expect (and also experienced) that other suppliers will not be ready yet to support this high standard. In second half of 2026 we will announce that we TLS 1.2 will be phased out by the end of that year. With this action we anticipate on the decision from NCSC to call 1.2 version unsafe. With this we underline our high standards in security.

TLS 1.3 will be implemented in JOIN Original:

- JOIN Case & Document Original
- JOIN Zaaktypen
- JOIN IDP
- JOIN Signing and Anonimizing services

- JOIN Burgerberichten
- JOIN Agenderen

This project will start in Q1. We aim to complete the project in the same quarter.

Extend MS Teams JOIN integration

To catch up with the competition (mostly Djuma from Circle) we want to introduce new features for the integration between JOIN Case & Document Original and MS Teams.

At this moment it is not yet clear what features we will implement. This will be prepared in Q1 and will be implemented in Q2. Possible features:

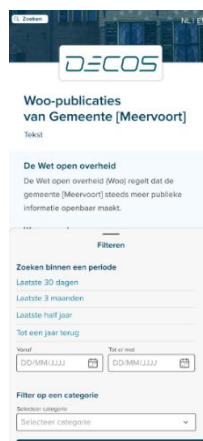

- Link a case to a channel from JOIN Original
- Link a document to a channel from JOIN Original
- Link a case to a channel from MS Teams
- Link documents from a team to a case in MS Teams
- Show with each document in Teams how it is saved to the case (ID, link)
- Show the reference with MS Teams from JOIN Original

Accessability improvements JOIN WOO Portal

We still see great opportunities with the JOIN WOO Portal despite the disappointing number of customers we still have.

When we look at the current feature stack of the portal itself there is no big need at this moment to extend this. From accessibility and usability perspective there is a need to make the WOO portal fully responsive. With this we can achieve 2 goals at the same time:

- Become fully WCAG 2.2 compliant (2.2 is currently the highest possible standard for accessibility).
- Give end users (mostly citizen) a solution that can be used on their mobile device (most likely the most common and widely used way to check for WOO documents).

This project will start in Q1. We aim to complete the project in the same quarter.

Extend the Postex integration

In very short time we have delivered a new feature called “Postex integration”. The feature allows a user within JOIN Original to select and send a document to Postex. Postex will take care of the delivery of the document to a citizen’s preferred communication channel, such as mail or Berichtenbox.

The postex integration has already been implemented with 3 customers and sales team expects more potential. On a short term already 10 new customers.

As we have chosen to go with the MVP of this feature (MVP stands for “minimal viable product”) we have decided to grow the capabilities of this feature in first half of 2026. This allows sales to start selling the solution and allows marketing to use the feature in their campaigns for WMEBV and will not delay their activities. Meanwhile, we will extend the feature.

Following features will be picked up in the upcoming months:

- Bulk sending of documents
- Sending documents from workflow computeractions

This project will start in Q1. We aim to complete the project in the same quarter.

Joni

Joni aims to be ad become a more reliable, intelligent assistant that supports user in their daily work. We will continue the development of Joni. The full roadmap for Joni can be found in the chapter about the AI roadmap.

JOIN Customer Contact

Productowner: Robin

Focus will be on delivering the following items:

JCC API integration (Start of Q1)

We are rolling out the new JCC API integration during start of Q1 for customers that are using JCC for appointment creation. The integration is improved and can also be sold to customers that are using JKC and JCC-Afspraken, but don't use the integration yet.

JKC currently already has an integration with JCC-Afspraken for appointment creation from within JKC. The current integration works with a webservice URL. JCC-Afspraken now offers an API and is projecting to migrate all customers on their end to the cloud and the API solution at the end of March 2026.

For the current integration to work in JKC, the user needs to have the JCC-Afspraken application open next to having JKC open. First, a person detail card needs to be opened in JKC. While that detail card is open in JKC, the user can click on Appointment and that will send the personal details (name, date of birth, e-mail address, BSN) to JCC-Afspraken. Those details are then filled in the appointment creation screen in JKC, where the user can continue creating the appointment. After appointment creation, the only way to link the appointment to the person detail card is based on BSN.

The new JCC-Afspraken integration works with the new JCC API. The JCC-Afspraken application no longer needs to be open separately, but JKC will trigger an iFrame window within JKC where JCC-Afspraken is displayed.

The available information of the person (name, gender, date of birth, and e-mail) is prefilled in the appointment screen.

The appointment can be created from within the iFrame. After saving the appointment, the appointment will be linked to the contact history and to the person detail card. Information

like location, the product, creation date, and appointment date are directly displayed on the person detail card.

LOCATIE	PRODUCT	REGISTRATIE DATUM	AFSPRAAK OP DATUM
Gemeentehuis Meerbergen	1 * Rijbewijs (aanvraag), 1 * Paspoort (aanvraag)	07 jan 2026 14:22	09 jan 2026 15:50 - 16:15
Gemeentehuis Meerbergen	1 * Paspoort (aanvraag)	07 jan 2026 14:17	08 jan 2026 10:35 - 10:45

The appointment can also be opened in detail to check additional information, like the notes/description added. The appointment can also be edited and/or deleted from the appointment detail screen.

NAAM	ADRES	BSN	ID	GEBORTE DATUM
Reuvers, F.	[Redacted]	[Redacted]	[Redacted]	01 jan 1960

Graph API (Q1)

JKC currently uses Exchange Web Services (EWS) in Exchange online for the following functionalities:

- Sending/forwarding e-mail from JKC
- Displaying the content of a mailbox in JKC
- Displaying the content of an agenda of an employee in JKC
- Display the availability of an employee based on the agenda in JKC

Microsoft is deprecating the existing Exchange Web Services (EWS) solution and transitioning to the Microsoft Graph API as its strategic alternative (<https://learn.microsoft.com/en-us/exchange/clients-and-mobile-in-exchange-online/deprecation-of-ews-exchange-online>).

According to Microsoft's published timeline, support for EWS in Exchange Online will end in October 2026.

Development is needed to support the Graph API to keep supporting the current functionalities.

The Graph API could provide a performance increase regarding fetching large amounts of e-mail. Furthermore, the Graph API also allows for expanding the functionalities that can be used like:

- Displaying the Teams presence for an employee in JKC (as opposed to the agenda presence)
- Displaying the out of office status of an employee in JKC

Additional AI Functionalities (Q2)

In 2025, we introduced the summarize feature in JKC by using the docu parser AI functionality. This feature allows users to summarize large texts from themepages and/or products and will also translate the text if needed. We will build upon the summarize features based on customer feedback.

Next to the summarize feature, we will introduce a JONI like chatbot in JKC that will make it possible to:

- Help with questions about the JKC application by searching the Wiki.
- Quickly search information from the provided sources like the PDC, Themepages or external sources like the intranet of a customer.

Improvements Social Media Module (Q1 & Q2)

Facebook Performance

The current Facebook integration was originally developed without message caching in mind. As a result, the system retrieves all (open) messages directly from Facebook each time the inbox is accessed. This approach leads to performance issues, particularly when handling large volumes of messages. Additionally, it causes JKC to repeatedly fetch messages whenever the inbox is opened, further impacting efficiency.

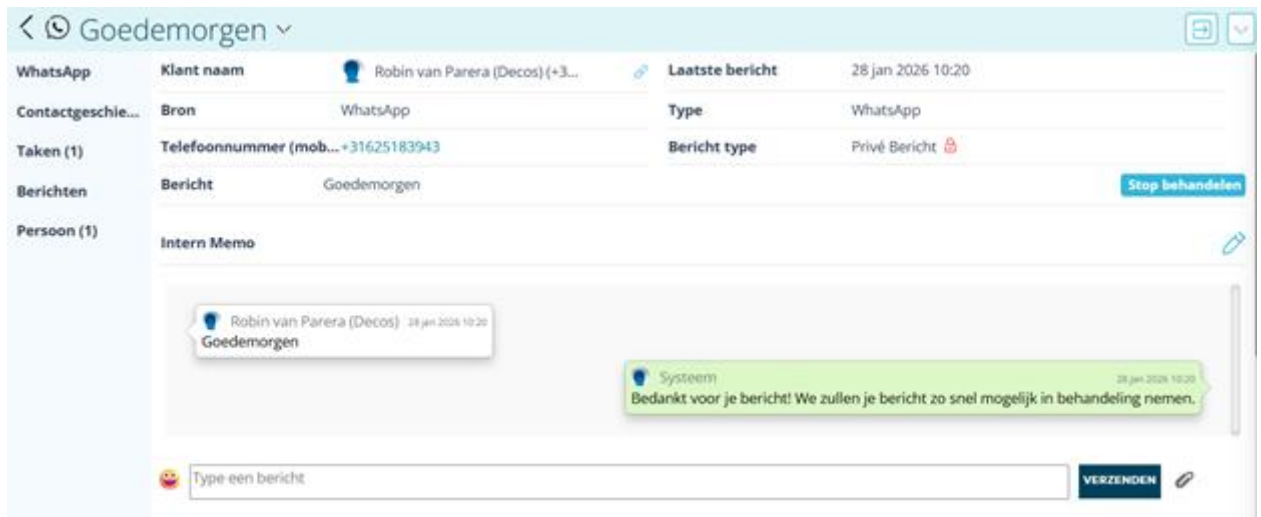

To resolve these issues, the Facebook integration must be redesigned to incorporate message caching. Implementing caching will significantly improve performance and reduce unnecessary data retrieval.

Templates

JKC already supports configuring and using templates for tasks and email communication, enabling users to quickly and consistently generate standardized content. We will extend this functionality to Facebook and WhatsApp, allowing customers to define and use templates when responding to social media messages.

The functionality will enable customers to:

- Configure multiple templates within the JKC Management Console for use with Facebook and WhatsApp.
- Select the appropriate template when responding to a social media message, ensuring faster and more consistent communication.

Those parts will be research in Q1 and implemented in Q2.

Fixi

Productowner: Sander

The upcoming 6 months the Fixi development will have 3 main goals:

Implement more AI capabilities in Fixi (remaining from 2025)
Improvements to increase customer satisfaction to reporters
Keeping our customers happy by working on wishes

Here below you can find the list of actions that we are aiming for *:

[AI] Photo prefills description (Q1)

A picture says more than a thousand words. But what if the picture could be the description of the problem? When creating a report, the description will be extracted from the attached photo, so residents barely need to type anything at all.

[AI] Photo category prediction (Q2)

With the AI API's we can also predict the category based on the attached photo. When we combine this with our category prediction of description we can increase the success rate of correct prediction.

[AI] Drag an email into Fixi to prefill the form with data from email (Q1)

In addition to photos, Word documents, and PDFs, emails can now also be dragged (or uploaded) into a Fixi report. When a municipality receives an email containing a complaint about public space, that email can be dragged into a new Fixi report. The available information from the email will be prefilled in the report, eliminating the need for manual retyping

Improvement in splitting issues (Q1)

It is already possible to split an issue when there are multiple problems mentioned in the description field of an issue. Now we are going to make it more visible in the issue detail page which issues are part of the original reported issue. In that way there are multiple ways to handle the other issues (with or without informing the reporter separately).

Add status type 'Externally handled' (Q1)

When an external handler replies on the email an internal comment will be added to the issue. In that way the handler will be informed. As 99 out of 100 times the issue is handled by that external handler, we are flagging the 'Forwarded' issue as 'Externally handled', like we do for 'Internally handled'. In that way also someone else from the municipality can see the handled issues and close them.

Change amount of days that a handled issues should be visible on the public map (Q1)

Customers want to change the amount of days that an handled or denied issues should be visible on the public map. We will make a configuration in the organization settings.

Send notifications on not picked up urgent issues (Q1)

We see more often customers who have urgent issues which are open for 3 to 4 weeks. We want to reduce that, so we will introduce a email notification that sends an overview on the open urgent issues. In that way a manager can be informed and act on

Show service targets in list and detail page (Q1)

Service standards will be clearly visible in the list of reports, making it easier for handlers to see when a report is exceeding the service target. There are already plenty of push and email notifications in place, but we expect this improvement to help meet service standards more consistently .

Add email and push notification for urgent issues + comment when issue is handled (Q1)

Fixi allows reports to be marked as urgent. Currently, we send a push or email notification when a report is assigned to a handler. If these notifications are disabled, it may take longer before a report is picked up — which is not ideal for urgent cases. A new notification type will be introduced specifically for urgent reports, allowing handlers to receive notifications only for urgent cases if they prefer.

Additionally, a separate email and push notification will be sent when a reporter responds to a completed report. This prevents handlers from receiving notifications for open reports; they will see these responses when they actively work on the report.

Integration with CityControl (Q1)

With the integration between Fixi and CityControl, handling reports in two separate systems becomes a thing of the past. We are actively working with Sigmax to improve the integration so that responses can be exchanged between the systems as well.

Disable commenting on handled issues (Q2)

More and more customers are asking for disable commenting on handled issues. Handlers won't read the comments after they handled issues and to prevent conflicts on 'It is handled properly' vs. 'It is not!' they want to block reporters to comment on those issues after a X amount of days.

Change user in bulk (permission etc.) (Q2)

A new feature will allow administrators to modify multiple users at once. Think of assigning certain permissions — such as dashboard access — in one go. This makes user management much faster and easier, especially when team structures change.

Excel export of comments (Q1)

At the moment, municipalities can export reports to Excel, but without the associated communication. With this enhancement, responses and feedback can also be exported. This enables municipalities to better monitor the quality of feedback and gain insight into communication. It also allows admin users to create standard response templates.

Satellite View (Q2)

Since the transition away from Google Maps, Fixi currently only offers a standard map view. With the introduction of a satellite mode, it becomes easier for both residents and staff to pinpoint locations more accurately.

Manually sending issues to case system (Q2)

Fixi has its own deletion module, but when a connection to a case system exists, all reports are forwarded automatically. With this change, it will also be possible to send only a single Fixi issue to the case system.

[Tentative] [Module] Displaying Maintenance Notifications from the Organization (Q2)

Fixi is increasingly used by residents to see what is happening in their neighborhood. This presents a great opportunity for municipalities to proactively post notifications about

planned maintenance — such as mowing schedules, playground repairs, or temporary road closures.

If a citizen wants to report, for example, that the grass is too long, they will see during the reporting process that a mowing session is already scheduled. This keeps citizens informed proactively and reduces duplicate reports.

[Tentative] [Module] Publish issues as municipality (Q2)

To further support proactive communication, residents can subscribe to push notifications about urgent matters in a region, neighborhood, or street (configurable by the organization). Municipalities can configure and send push messages to app users via the organization settings. If there is a gas leak or power outage, the municipality can immediately inform Fixi users.

** When we win the tender of Breda, there will be some more features required like:*

- *Link issues*
- *Push notifications to anonymous app users*
- *Show more statuses then we currently use*

WePlog

Productowner: Jorrit

our environment we will work on fixing all the security related issues in Q1 and solve some technical debt items in Q1 and Q2

Besides that, we will, based on customer feedback, start introducing some new features.

Availability in different countries

Make WePlog available in Germany and Spain. For this, the maps of the municipalities need to be added to the application. We are prioritizing this because we already have several Fixi customers in Germany, and we want to offer them, and future customer, the opportunity to embrace the potential of WePlog and to encourage citizens to help keep their surroundings as clean as possible.

User friendliness

- Allow users to change their email address via the app. Main requests we get from support side is to change email address. We want to give the user control over this process by making this available within the application.
- In Q1 we will research the possibility to plog anonymously. Currently, to use our app you need to create an account. You can choose to anonymize your data, but we want to see if users can use our app without an account. Municipalities should still receive this data in their overviews when a plog session has been done anonymously.

Student transport (Menuet)

Productowner: Robin

Current focus is on transitioning the required student transport functionality to DCP.

Focus for legacy student transport will be on supporting the current solution until we can migrate customers to the new DCP solution.

Customer migration to DCP (Q1 / Q2)

To ensure a smooth transition to the new DCP solution, we will begin by investigating and preparing the migration process for current LV.NU customers. This includes assessing how existing data from the LV.NU administration can be transferred into cases within DCP. In addition to case-related information, we will also need to migrate all essential documents, such as official decisions ("beschikkingen").

Integrations

Productowner: Jorrit

From an Integration perspective the main focus will be on maintaining a stable product since our goal is to sell the integrations via our JOIN Integrations

Where we will solve some technical debt issues in Q1 and introduce support for TLS 1.3 in Q2.

For ZGW we continue with some bug fixes and introducing some missing features, like making EMAIL and Phone available in ZGW properties and correctly setting status on a document.

The new feature that will be introduced in Q1 is the monitoring of the ZGW messages in the JIA. Initially, message type and result will be displayed.

In Q2 we will look at the possibilities to expand this with message details and log information, similar to what can be seen now for the StUF related messages.

2.3.2. Doclogic

Data Integrator

As part of our long-term platform strategy, the Data Integrator will gradually be phased out and fully replaced by JOIN Integration. This transition ensures a more scalable, secure, and future-proof integration platform for all stakeholders.

- **No New Clients**
The Data Integrator is no longer offered to new customers. All future implementations will be delivered exclusively through JOIN Integration
- **Active Migration of Existing Clients**
- All existing Data Integrator customers will be proactively approached to make sure we can migrate them.

2.3.3. CenterOne

Productowner: Paul

ProcessPro Blazor Version

The following modules are scheduled for completion in Q1:

Groundwater Extraction (Grondwateronttrekking)

This involves converting the ProcessPro Domino module to the ProcessPro Blazor version. This module allows for the maintenance of annual groundwater extraction statements. A separate project is created each year. Responsible parties are notified by letter/email via Postex. Meter readings can then be submitted via a portal. Ultimately, an export can be created containing all annual statements that need to be submitted to the LGR (National Groundwater Register).

Fees (Leges)

This involves converting the module from the ProcessPro Domino version to the ProcessPro Blazor version. This module records the applicable regulations. There's also an option to export the imposed fees for further financial processing.

Legger

This is a new module we are developing for our client. This module safeguards the process surrounding the Legger (Register of Public Works and Water Management). A Legger is a legal register, often managed by Rijkswaterstaat or water boards, detailing the location, dimensions, and maintenance requirements for infrastructure such as dikes, dams, and waterways. It defines the mandatory technical condition of these assets. Management register changes are created during the permitting process, which can lead to a change to the Legger. This must be reviewed by various departments.

The following module will begin in Q1 and is expected to be completed in Q2:

Objections & Appeals (Bezwaar en Beroep)

This is a new module we are developing for our client. It safeguards the Objections and Appeals process. Links can be made with Permits, Inspections, Incidents, Locations, etc.

The following modules will begin in Q2 and will be completed in Q3:

Dike Inspection (Dijkinspectie)

This involves converting the ProcessPro Domino module to the ProcessPro Blazor version. This module safeguards the dike inspection process. Areas are identified and work orders are issued. The work can be retrieved and processed via the mobile app.

Exotic Species (Exoten)

This involves converting the module in the ProcessPro Domino version to the ProcessPro Blazor version. This module records exotic species and the measures taken to combat them. Everything is visible on the map, as is most ProcessPro.

The following general components are scheduled for H1:

Anonymization

Self-explanatory, it concerns the anonymisation of documents, including the submission of documents to DROP.

Digital Signing

It also speaks for itself, digital signing of document, facilitated by the work process.

ProcessBuilder Macros

Within the various processes used in ProcessPro, there are specific tasks you'd like to have performed, such as creating sub-items, making bulk adjustments, and so on. Currently, this is facilitated by Domino Agents. A different approach is needed for this, as Domino is being phased out.

Ongoing: Technical Debt**ProcessPro Domino version**

There are no developments on the roadmap for the Domino version of ProcessPro. The goal is to keep existing customers satisfied, which means that any minor adjustments may be necessary. The identified technical debt will also be resolved where possible.

ConnectoOne

For ConnectOne there are no new functionalities on the roadmap for the first half year. We will, of course, fix bugs as they are discovered. We will also address security issues and any remaining technical debt.

2.3.4. Ziuz Forensics and Digital Investigation

Productowner: Marlyne

The focus for Q1 is getting Fenoz ready by the end of Q1. Once this is complete, we can start planning customer demonstrations. In Q2 we start integrating Aviator into Fenoz to get rid of third-party dependency and make use of the video and image capabilities of Fenoz. This will allow us to get rid of a lot of technical debt and make sure we are in full compliance with the NCMEC API.

In the meantime, we will address some technical debt of modules used within VizX2. These modules have not been updated and are several versions behind. The need is there as there are security vulnerabilities in some of the nuget packages. We expect to finish this in Q2 or Q3 depending on the capacity constraints.

In the following sub chapters you can find the list of actions we are aiming to do for every product:

VizX2

Technical debt planned for 2026:

- Upgrade opencv_runtime on latest version
- Upgrade ExifTool on latest version
- Upgrade Nevron Vision on latest version
- Upgrade SpreadsheetLight on latest version
- Upgrade Xceed Extended WPF Toolkit
- Upgrade GMap.NET.Core on latest version
- Upgrade LEADTOOLS SDK
- Upgrade Scintilla NET on latest version
- Upgrade several nuget packages due to security vulnerabilities.

Aviator

- Delivery of Aviator 2.0 as part of Fenoz by end of Q2
- Upgrade NCMEC API to latest API specifications. Aviator licensing will be integrated with the Fenoz licensing so the license tool can handle if a customer wants both Aviator and Fenoz or only Aviator or only Fenoz.

Fenoz

Delivery of Fenoz 1.0 by end of Q1

- UI Screens finished
- Reporting Module (last module) done
- Polishing of the whole software UI & technology wise
- Integrate Fenoz licensing into the Decos License tool

2.3.5. Seneca

Productowner: Robin

Formserver

FORMULIEREN SERVER

Formserver functionalities are currently being rebuilt as JOIN Form. Because of the work done within the Decos cloud platform, we will spend less time on new functionalities within Formserver. We hope to migrate our first customers from Formserver to JOIN Form by the end of Q2.

Shared design for Formserver (Q1/Q2)

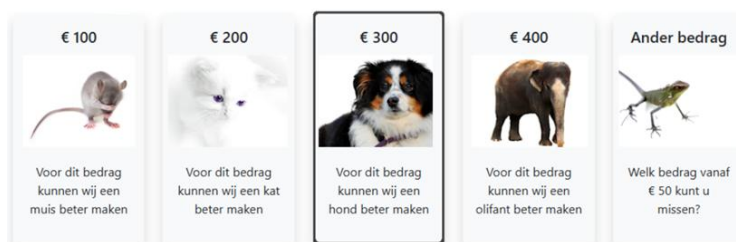

In the upcoming period, we will focus on establishing and implementing a shared design for the Formserver solution. The objective of this initiative is to create a standardized look and structure across all forms, ensuring consistency in both user experience and technical implementation.

The primary benefit of this approach is improved maintainability. By working with a shared design, we can minimize complexity, reduce the risk of inconsistencies, and ensure faster and more reliable updates. In addition, it will provide a clear framework for future development, making it easier to onboard new team members and align stakeholders on design standards.

Periodiek schenken (Q1)

We can make the form that can be used for “periodiek schenken” (and general Formserver solution) more visually appealing by introducing the following options:

- Visually more appealing options for creating selection lists.
(Example / mockup)

- Setting a prefix for numbers and text fields so users can't break the form by adding special characters we are not expecting.
- Add a banner on top of the form to make it more visually appealing.

A visually standardized form convinces more charities and thus resulting in more new customers. Existing customers (approximately 40) will likely want this adjustment in their forms as well; this means consultancy effort + happier customers + more successfully completed forms (beneficial for pay-per-form).

These changes provide added value for all Formserver customers. For example, the new

list of control can also be used by a municipality that wants to survey residents in a neighborhood about which playground equipment they prefer.

Stability / Technical Debt (2026)

There is a continued focus on ensuring that Formserver runs in a stable and reliable manner. Alongside this, we will actively address and reduce existing technical debt by prioritizing necessary refactoring, upgrades, and structural improvements. This balanced approach ensures that day-to-day operations remain stable while we continuously improve the long-term maintainability, performance, and resilience of the Formserver solution.

Smartsite

Smartsite release 8.2 / Update interface (Q1)

The Smartsite 8.2 release has been postponed to the beginning of Q1 due to identified security issues. This release includes a significant number of bug fixes as well as the updated interface for the Smartsite Manager.

Key Enhancements

- A more modern layout and typography
- Improved visual hierarchy
- Increased spacing for a cleaner and more organized interface
- Enhanced usability on larger screens
- Searchable filters for faster navigation
- Updated, modern filter styling

Improvements

- All icons have been fully redesigned
- Decos Color Scheme
- Automatically Scalable Text Size
- Dark Mode

Default templates for Smartsite (Q1/Q2)

In addition to Formserver, we also need to focus on introducing default templates that can be used for Smartsite websites. These templates are essential to ensure that Smartsite can be updated, maintained, and further developed more easily and consistently over time.

The default templates should include standard functionality and features that add clear value to customers. By offering a rich and well-designed baseline, we create tangible benefits for customers to move towards and adopt the shared template approach, such as improved accessibility, consistency, performance, and reduced maintenance effort.

As a starting point, we can use the Rijksoverheid website (<https://www.platformrijksoverheidonline.nl/functionaliteiten>) and its published functionality overview as a reference to identify which features are required, expected, or

particularly helpful for users. This will help ensure that the Smartsite default templates align with proven standards and best practices, while remaining flexible enough to support customer-specific needs.

Introduce AI-features in Smartsite (Q1/Q2)

The focus for AI-features will focus on two aspects of Smartsite:

- Introducing additional features in the Smartsite Manager to assist the user in creating and adjusting content
- Using AI (chatbot) to assist users to more accurately find the information they're looking for.

Smartsite Manager

Features to include in the Smartsite Manager are:

- Adjust text to the required reading level
- Translate textSpellcheck on selected text

Redesign Smartsite (Media) Manager

Aspects of the Smartsite Manager need to be redesigned to ensure better customer usability. Aspects that should be focused on are:

- UI/UX
- Making it easier to attach/upload files to the manager and content
- Making the overview of uploaded files more user friendly

3. APPENDICES

3.1. TECHNICAL DEBT

We want to ensure that we are working with the latest (external) techniques and security guidelines according to our own policies. We are obligated to ourselves and to our customers that our software is of the highest quality and security standards.

To ensure we are not falling behind and create security risks and/or the velocity of our development is dropping this topic is recurring and always on top of our action-list.

The full list of technical debt items can be found here and is maintained by our Quality Assurance (QA) team:

 [Technical-debt-overview-Decos-solutions.xlsx](#)*

**Reading Guide*

- *Our goal is to avoid any major issues.*
- *Minor issues must always be addressed in a timely manner to prevent them from developing into major gaps.*

3.2. RELEASES

Here you can find the release planning for all Decos products:

NL - <https://wiki.decos.com/nl/releases/releasenotes>

EN - <https://wiki.decos.com/en/releases/releasenotes>

Since we have many multitenant cloud applications (Fixi, Zaaktypen, Eforms, WOO Portal, Regelhulpen etc. etc.) within our Decos Solutions Stack and every solution has their own level of development (for example the development effort of Fixi is much higher than the development effort of Agenderen or JKC Admin) most cloud apps don't have a fixed update rhythm. Except Fixi (where we do 2 monthly updates to shorten time-to-market) other solutions will not have a fixed update schema. We will push an update when we have something to deliver to our customers (eg. Bugfixes, security improvement or new features).

3.3. PENTEST & SECURITY

To ensure we deliver secure applications we have implemented pentest cycle for all our applications. We will pentest our single tenant applications (JZD Original, JKC, ProcessPro and Integrations (Existing)) prior to our major releases. This means that we will not release our solutions when they contain priority security issues reported by pentest.

Our multitenant cloud solutions will be pentested as well before major releases. Same applies here concerning the release approval process.

All other applications will be pentested at least one time in 2026:

- JOIN Zaaktypen
- JOIN Klantcontact Admin
- IDP (central admin cloudapps)
- JOIN Burgerberichten (Eforms and PIP)
- JOIN Agenderen
- Event Assistant (Regelhulp)
- Income Assistant (Regelhulp)
- Student Transport (Regelhulp)
- Doclogic Portaal
- Doclogic Dataintegrator
- CenterOne ProcessPro
- CenterOne ConnectOne
- Fixi
- Cloud Services (KVK, Signing, Anonimization, MS Teams)
- AKS Admin (private cloud control panel)
- Forms Server (Seneca)
- Smartsite (Seneca)
- WePlog
- ProcessPro (CenterOne)
- ConnectOne (CenterOne)
- Joni (AI Assistant)
- AI services (general, consumed by all our solutions)

Full schedule of pentest releases can be found here:  [Pentest Schedule & report 2025-26.xlsx](#)

3.4. WCAG TEST (ACCESSIBILITY)

Every application will be tested on WCAG 2.1 or WCAG 2.2 at least one time per year. QA will perform this action and generate the report.

Accessibility report will be published on: <https://decos.com/nl/toegankelijkheid>
WCAG compliancy testing will be done internal and not by an external organization. Reason for this is that it is not required by any law or regulation. In case a customer requests we can offer this as a paid service or allow the customer to have it done themselves.
